iLinux OS Talk

iLinux is very good !

The dude 123 13 Mar 2022 07:57:18

hello forums ! i decided to make a account in here to chat with ilinux cummunity ! i am not good in egnlish (i am chinese)

i wnted to install ilinux for my kids who got their computer and it"s very smooth and very very good ! thank you !!!

i also find out there are too many aps installed. why is there so mani aps ? there is ap store am i right ? cant we install from that ?

Hello and welcome to iLinux OS!

iLinux OS has many Apps preinstalled in order to be ready for use Out of the Box and for an optimum User Experience.

Of course there is an App Store and you can install thousands of Apps from there too.

It's called "iLinux Software Store" **https://ilinuxos.com/ilinux-software-store.html** and you can find it at the bottom dock or in "iLinux Menu" **https://ilinuxos.com/ilinux-menu-and-smart-links.html** or in "Application Finder" **https://ilinuxos.com/application-finder.html**

iLinux has BUILT-IN COMPATIBILITY with all the latest Software Technologies out of the box!

App Image, DEB, Flatpak, Snap, Steam Games & VirtualBox OS Emulator to run Mac & Windows Software.

iLinux embeds Gnome Software Store, Snap Store, App Images, Electron Apps, Steam Games Store, Simple Package Manager & Synaptic Package Manager.

All in one place. In one window. For your convenience.

Feel free to contact us here for any help or assistance!

All the latest ones? You are still based on Debian 10, going to 11 soon, and the software is from December 2020/Early 2021. There is Flatpak and Snap which have newer though. I'm surprised you don't hate Snap despite most of the Linux community (or mafia according to you) hate Snap.

#3. iLinux Support Team 13 Mar 2022 12:52:45

@AaronTechnic

Flatpak and Snap software is still running fine on Debian 10.

Debian 10 Stable is not old. It is mature and Stable.

It's LTS Life (**https://wiki.debian.org/LTS**) ends on June 2024 and it's ELTS Life (**https://wiki.debian.org/LTS/Extended**) hasn't yet been determined.

Operating System Stability is the #1 priority for us and we don't settle for anything less.

An Unstable Computer is a Useless Computer.

We prefer a slightly "older" Stable OS over a "newer" Unstable OS.

Without Stability the Computer Fails to execute the User's Commands and the User Experience Fails.

If the User Experience Fails, the Operating System Fails.

This for us is intolerable.

There is a difference between using Linux for fun or experimentation and using Linux to get work done.

Unstable or newly released Core Linux Distributions are not suitable for getting work done.

If you disagree you can use any other Linux Distribution.

No one is forcing you to use iLinux OS.

We do not hate anyone or anything.

Of course we disagree with the mentality and with the architecture of the Snap Software Layer but we believe that Users must have the ability to run Snap Software Out of the Box if they want to.

The so called and Self Proclaimed "Linux Community" that is controlled by the "Linux Mafia Army" has nothing to do with the real Linux Community.

The real Linux Community is the SUM of ALL Linux Users and ALL Linux Developers.

We have been over that before. There is no point in repeating the same things all over again. If you want to discuss it any further please open a new Thread and don't disrupt irrelevant Threads.

> *“ Debian 10 Stable is not old. It is mature and Stable. ”*

It is indeed mature and stable, but I think it's considered "old" because the software in Debian 10 is from 2018 or 2019.

> *“ We prefer a slightly "older" Stable OS over a "newer" Unstable OS. ”*

Your opinion really but it depends on the software packaged in it. Just because it's old doesn't mean it's the most stable, and the same goes for newer, but saying newer is unstable isn't right honestly. I'm not saying bleeding edge (like Arch) but something like a few months old. iLinux is based on Debian so you can't control that so ok.

> *“ Without Stability the Computer Fails to execute the User's Commands and the User Experience Fails. If the User Experience Fails, the Operating System Fails. This for us is intolerable. ”*

I wish Canonical did the same, LOL. Ubuntu had a perfectly functioning GNOME Software center before Ubuntu 20.04 which "just works".

For some reason they decided to switch to the Snap version of GNOME Software which is not really as stable or functional as the standard GNOME Software app. It is improving and getting better, however they need to ensure stability for Snap apps (they do ensure stability for the standard system which is nice)

They replaced Firefox with the Snap version of Firefox (which is as good as the standard version, and Mozilla wanted this change and not Canonical) however you can't use native host connectors, meaning that browser extensions like GNOME Extensions and Plasma Browser Integration won't work (unless the connector is packaged as a snap)

> *“ Of course we disagree with the mentality and with the architecture of the Snap Software Layer but we believe that Users must have the ability to run Snap Software Out of the Box if they want to. ”*

I believe Manjaro does that. Snap is very weird to me because of it's design, but it works and setting permissions to snaps are easier than flatpak, which is nice.

> *“ We have been over that before. There is no point in repeating the same things all over again. If you want to discuss it any further please open a new Thread and don't disrupt irrelevant Threads. ”*

I guess my conclusion was I probably wasted my time here. I disagree with the way you make iLinux (because 500 apps, why? Don't want to fight about it though)

#5. iLinux Support Team 13 Mar 2022 17:51:54

@AaronTechnic

> *“ the software in Debian 10 is from 2018 or 2019 ”*

Debian 10 was released on 6th of July of 2019.

https://wiki.debian.org/DebianReleases

> *“ Just because it's old doesn't mean it's the most stable, and the same goes for newer, but saying newer is unstable isn't right honestly. ”*

It depends on the Linux Distribution and on the sum of the Applications you use.

In the case of iLinux OS we are absolutely honest.

38 years of Experience in computers has taught us that for Maximum Stability and Critical Mission Projects, you must never adopt a new Operating System immediately. A period of at least 6 months after launch is absolutely neccesary for Testing and Debugging.

Again, if you want to discuss anything irrelevant to any Thread, just open a new Thread and don't disrupt irrelevant Threads.

> *“ iLinux OS has many Apps preinstalled in order to be ready for use Out of the Box and for an optimum User Experience. ”*

Windows doesn't have that much bloat and still become the most popular OS, even for who doesn't even used a computer before. I hope Linux will dethrone it and it's just a matter of time (and probably the community too).

When all peoples in the world are creating tools and software to remove all useless bloats that this people might need but they won't, you just straight up include more than 500+ bloats.

> *“ App Image, DEB, Flatpak, Snap, Steam Games & VirtualBox OS Emulator to run Mac & Windows Software. ”*

I doubt everyone will know how to create a Virtual Machine. Creating and setup a Windows VM might be easier, but setting up a Mac VM is a pain. And it requires a lot, a lot of your computer

resources to be allocated. And you want your OS to be smooth on old PC, then VirtualBox is probably the first thing to take consideration. It requires VT-x or AMD-v (depend on CPU) which not everyone know how to go to BIOS!

Snap is a hot garbage. It's a semi proprietary thing that is just outright garbage. Some APT packages are just the metapackage to the snap.

> *“ 38 years of Experience in computers has taught us that for Maximum Stability and Critical Mission Projects, you must never adopt a new Operating System immediately. A period of at least 6 months after launch is absolutely neccesary for Testing and Debugging.* ”

Windows 11 just released on October 2021 and now a lot of people was using it (people are trying to use it on older hardware too, despite it's just released for a short time).
And Debian 11 is released way before Windows 11.

And of course, let's move to a new thread shall we?
